But the "new" CoffeeScript has components that are different than CoffeeScript and that are not officially supported by TypeScript. If that's important to you, consider using one of the following workarounds: How can I know if it's TypeScript or not? If someone tells you it's TypeScript, they're wrong. It is not TypeScript. TypeScript is a superset of JavaScript with optional types, which is also a superset of JavaScript. TypeScript is not a superset of CoffeeScript. TypeScript is a superset of CoffeeScript with optional types. If you want to know if your JavaScript code is TypeScript, use my little type checker: In clinical practice, many doctors and patients are unaware that many of the skin diseases that they observe are treatable. The purpose of this study is to determine how many primary care doctors already treat skin diseases under their clinical practices and determine the reasons for their failure to treat and/or be aware of each of the conditions included in this study. A two-part study will be performed: Phase I. Will survey all primary care physicians in the Halifax Regional Municipality, Nova Scotia. Phase II. Will determine the prevalence of the types of skin disease that the primary care physicians in Phase I treat and/or are aware of. In Phase I, all physicians in the HRM will be asked to complete an email-based survey about how often they treat skin disease; the skin conditions they treat the most and least often; if they are aware of any resources they would like to be reminded of and how they learn about skin conditions. In Phase II, the primary care physicians who responded to the Phase I survey will be sampled in a non-probabilistic manner. The sample will be stratified for the number of years practicing and for whether or not they belong to a practice group. The stratification of the sample will ensure an even distribution of respondents for any conclusions that might be drawn from the survey. The respondents will be asked about the

A fluid is poured into the container, then a time Δt is allowed for the fluid to drain. The volume of the liquid is $V = 11 \text{ cm}^3$. The surface area of the container's bottom is $A = 12 \text{ cm}^2$. Find the maximum pressure and the speed at which the fluid is drained when $\Delta t = 0.5 \text{ s}$. So I know that to compute the maximum pressure I would have to find the maximum internal pressure and find the normal force acting on the bottom of the container but there isn't much info on how to approach the problem. Since I'm really only familiar with solving problems involving pressure, I'm not really sure how to go about this one. A: You need the equivalent weight of the water to find the maximum pressure. $P_{\text{top}} = \frac{F}{A} = \frac{50 \text{ g}}{12 \text{ cm}^2} = 3.8 \text{ Pa}$ You'd then find the flow rate as: $Q = \frac{V}{\Delta t} = \frac{11 \text{ cm}^3}{0.5 \text{ s}} \approx 2.66 \times 10^{-7} \text{ m}^3 \text{ s}^{-1}$ And speed as: $v = \frac{Q}{A} = \frac{2.66 \times 10^{-7}}{12 \times 10^{-4}} \approx 1.67 \times 10^{-4} \text{ m/s}$
