I am very new to Spring Security. Can anybody tell me if there is any difference between JPA Filter and Spring Security Filter in regard to the authenticator? A: Spring Security is a framework that includes multiple components, among them: authentication — authentication for managing users authorization — authorization for managing user access to application resources exception handling — handling error conditions, including redirected responses, i.e. Spring Security redirects HTTP requests to a URL of a resource that requires authentication (for example, /user/) to a URL of a resource that can be accessed without authentication (for example, /app-viewer/). web application security configuration — Spring Security can specify which application pages can access which application endpoints. web filter — A filter is a pluggable component that implements the interface org.springframework.web.filter.Filter that Spring Security uses to process HTTP requests. A web filter reads incoming requests and decides whether they should be accepted or refused by the server. It can also log the request and response. login processing — Spring Security's login processing configures and authenticates user sessions. So Spring Security itself doesn't implement anything like JPA Filter, but it has a huge number of configurations that you can manage and extend. JPA Filter is a standalone Spring component that helps you manage the persistence of your objects with J
